Indeed, one of the classic photochemical reactions of organic chemistry is the formation of 1,1,2,2-tetraphenyl-1,2-ethanediol (3, benzopinacol) by the action of light on a solution of diphenylmethanone (2, benzophenone) in isopropyl alcohol. The yield is quantitative.

28.3: Organic Photochemistry - Chemistry LibreTexts

For this reason photochemistry for many years was the domain of physical and theoretical chemists. Their work laid the foundation for modern organic photochemistry, which correlates the nature of excited electronic states of molecules with the reactions they undergo.

ORGANIC PHOTOCHEMISTRY An extraordinary variety of reactions of organic compounds are known to occur under the influence of visible and ultraviolet light. Some of these, such as the photochemical halogenation of alkanes and photosynthesis in green plants, already have been discussed (see Sections 4-4D and 20-9).

PHOTOCHEM

The photochemistry is the field of chemistry, which deals with the effect of electromagnetic radiation in the form of light or photons to chemical molecules, reactions or systems.

Photochemistry

Photochemistry is the underlying mechanism for all of photobiology. When a molecule absorbs a photon of light, its electronic structure changes, and it reacts differently with other molecules. The energy that is absorbed from light can result in photochemical changes in the absorbing molecule, or in an adjacent molecule (e.g., photosensitization).

BASIC PHOTOCHEMISTRY - Photobiology

Description : Organic photochemistry is the science arising from the application of photochemical methods to organic chemistry and organic chemical methods to photochemistry. It is an interdisciplinary frontier. Intense activity in organic photochemistry in the last decade has produced so vast an accumulation of factual knowledge that chemists in general have viewed it with awe. Even those chemists engaged in the study of organic photochemistry will find the rate of development in the field ...

Photochemistry is the branch of chemistry concerned with the chemical effects of light. Generally, this term is used to describe a chemical reaction caused by absorption of ultraviolet (wavelength from 100 to 400 nm), visible light (400-750 nm) or infrared radiation (750-2500 nm).
