Physics Classroom Electric Circuits Answers

Answer: BCE. To establish an electric circuit, charge must be moved from low energy to high energy. Once at high energy, the charge spontaneously flows through the conducting wires and other conducting elements of the circuit back down to the low energy terminal. A battery's role is to supply the energy which is required to move the charge from the - terminal to the + terminal of the battery.

Electric Circuits Review - Answers #2 - The Physics Classroom

Answer: See answers above. In an electric circuit, the electric potential for a moving charge is gained in the battery and lost in a light bulb (or some resistor found in the external circuit). So the electric potential of a charge is the same for any two points which are not separated by a battery or by a light bulb. (a through d)

Electric Circuits Review - Answers #3 - The Physics Classroom

Answer: 360 Ohms. The power dissipated in a circuit is given by the equation $P = I \cdot \Delta V$. Substituting in $\Delta V/R$ for the current can lead to an equation relating the resistance (R) to the voltage drop (ΔV) and the power (P): $P = I \cdot \Delta V = (\Delta V/R) \cdot \Delta V = \Delta V^2 / R$.

The Physics Classroom Tutorial: Electric Circuits

Answers: See table above. The electric force (F elect) is computed using Coulomb's law: $F_{\text{elect}} = k \cdot Q_1 \cdot Q_2 / d^2$, where Q 1 and Q 2 represent the charges on the two objects, d represents the separation distance between the object's centers and $k = 9 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2$. This equation can be rearranged to solve for any quantity in the equation.
