Domain testing is the most widely taught (and perhaps the most widely used) software testing technique. Practitioners often study the simplest cases of domain testing under two other names, "boundary testing" and "equivalence class analysis." That simplified form applies –Only to tests of input variables –Only when tested at the system level –Only when tested one at a time –Only when tested in a very superficial way In competent practice, and in the research literature, all of these ...

An introduction to the theory and practice of domain testing

Domain Testing is a Software Testing process in which the application is tested by giving a minimum number of inputs and evaluating its appropriate outputs. The primary goal of Domain testing is to check whether the software application accepts inputs within the acceptable range and delivers required output.

Pulsed eddy current (PEC) testing has attracted researchers' interest because the pulsed excitation comprises a broad band of frequencies and the response signal provides more information about defect than traditional eddy current testing. Various features have been extracted from PEC signal for defect characterization.

A conserved paired domain of 127 aa was included in the predicted protein sequence . The full length TtPax1/9b cDNA contains 1893 bp, while the ORF is of 912 bp encoding 303 aa with a predicted MW of 33.2 KDa. A conserved paired domain with 127 aa in length is also present in the TtPax1/9b protein sequence .
